General Description

Nearly all the land in this town-
ship is good agricultural land
but subject to overflow, which
usually occurs once a year, in
the month of June, in the Eastern
portion is the irrigating canal
from which the most of the
land can be irrigated, Most

The Colorado River Meridian, Chains

of the western portion is covered with a dense growth of arrow-weed; The timber does not grow large, but is confined, to a very dense growth of small willows, and some cottonwoods with mesquite in the Eastern portion of the township. All the stone used for corners had to be hauled from the hills S.E. from the township. No grass except in a few isolated spots. The Northern portion of the township is entirely cut-off by the Colorado River which has a general Western course through the township. The average width of the stream is about 30,00 chs. It has a swift current, with low

Township 2 N. Range 1 W. of the Chains

low banks, the stream is navigable for steamboats of light draught in low water. The sloughs running through the township run out of the river and return to it again, but have as a general thing no water in them except when the river is high.

The slough in Section 28, ran out so that the crossings could not be taken.
