Dense undergrowth 17.30 chs.

April 12, 1902.

General Description.

This township contains river bottom, valley, mesa, and mountainous land, and the soil ranges from rocky to rich loam. The valley of the Colorado River, that commences at about the center of sec. 30 and extends thence northward some 15 miles is generally known as, and called the Cibola Valley; the soil of that part of said valley that is within this township is mainly rich, yellow loam, and produces, when irrigated, abundant crops. The soil on the mesa is 2nd rate and requires irrigation. The mountains are barren, rocky and void of soil, and probably contain

valuable minerals. Most of the Cibola Valley is densely covered with timber, mainly mesquite and tormo, with cottonwood and willow along margin of stream; Arrow-wood brush undergrowth on much of the valley.

Palo verde and pals fierro timber grow in the washes and narrow valleys between mesas. There are two settlers in sec. 18, and one in sec. 30.

The Desert Land Claims of Samuel T. Todd, Leo Frankenberg, and Adolf Frankenberg in secs. 5 and 6 maybe irrigated by canal from Colorado River, now partly constructed.

J. A. Barry

U. S. Deputy Surveyor.
