PRELIMINARY OATHS OF ASSISTANTS.

WE, Arthur Pague

and Harry Mallory

do solemnly swear that we will well and faithfully execute the duties of chainmen; that we will level the chain over even and uneven ground, and plumb the tally pins, either by sticking or dropping the same; that we will report the true distances to all notable objects, and the true lengths of all lines that we assist in measuring, to the best of our skill and ability, and in accordance with instructions given us, in the survey of

the Subdivisions of T. 23 S. R. 20 E.

Subdivision of T. 23 S., R. 20 E.

Survey commenced July 14, 1906, and executed with a Young & Sons light mountain transit, Smith's Solar Attachement No. 5809. The horizontal limb is provided with two double verniers placed opposite to each other reading to single minutes of arc, which is also the least count of the verniers of the latitude and declination arcs.

The instrument was examined, tested on the true meridian at Phoenix, found correct, and was approved by the surveyor general for Arizona, July 1, 1906.

I examine the adjustment of the transit, and correct the level and collimation errors; then, to test the solar observations made during a.m. and p.m. hours, with a meridian determined by observations on Polaris, I proceed as follows:

At the cor. of secs. 1, 2, 35 and 36, on the S. bdy. of the Tp., previously described; latitude $31^{\circ} 22' N.$, longitude approximately $110^{\circ} 16' W.$, I set off $31^{\circ} 22' N$ on the lat. arc, and $21^{\circ} 45' N.$ on the decl. arc, and at 5h 5m., p.m., l.m.t., determine with the solar a meridian and mark the point thereof, on a stone firmly set in the ground, 5 chs. N. of the cor.

July 14, 1906.

July 15: At 0 h 3 m., A.M. by my watch, which is 2 m fast of l.m.t., I observe Polaris at eastern elongation in accordance with the Manual of Instructions, and mark a point in the line thus determined, on a peg driven in the ground 5 chs. N. of my station.

At 6 h 55 m a.m., l.m.t., I lay off the Azimuth of Polaris $1^{\circ} 35'$ to the west, and mark the meridian thus determined, by cutting a small groove in the stone set July 14, on which the meridian falls 0.3 ins. west of the mark determined by the solar.

At 7 a.m., I set off $31^{\circ} 22' N.$ on the lat. arc and $21^{\circ} 38' N.$ on the decl. arc; and mark a point in the meridian determined with the solar, by a cross on the stone already set 5 chs. N. of my station; this mark falls 0.4 ins. east of the meridian established by the Polaris observation.

The solar apparatus by a.m. and p.m. observations, defines positions for meridians, respectively about $0^{\circ} 16' E$ and $0^{\circ} 21' E$ of the meridian established by the Polaris observations; therefore, I conclude that the adjustments of the instrument are satisfactory.

The magnetic bearing of the true meridian at 7 a.m., is $N. 12^{\circ} 27' W.$; the angle thus determined gives thermag. decl. $12^{\circ} 27' E$.

General Description.

This township is bounded on the north by the Huachuca Military Reservation and embraces a portion of the Huachuca Mountain Range. There is an abundance of oak timber and some pine timber is found on top of the mountains.

The township is well watered by a number of springs and running streams. The soil is gravelly and rocky. There are some settlers within the township, whom have made some substantial improvements. The reservoir that supplies the water to Tombstone is situated in Section 23.

Note. After diligent search I have been unable to find any trace of any mining claims that have been surveyed for patent. In order to avoid unnecessary delay and expense, I therefore will endeavor with endeavor to make a special search after completion of all my surveys under contract No. 138.
