## Chains.

Survey commenced Dec. 6, 1910, and executed with a W. & L. E. Gurley light mountain transit, special make, unnumbered, with Burt's patent solar attachment. The horizontal limb of the instrument is provided with two double verniers placed opposite to each other, and each reading to 1' of arc, which is also the least reading of the verniers of the latitude and declination arcs.

At the Std. Cor. of secs. 35 & 36, on the South boundary of the township, I examine and test carefully all the adjustments of the transit and solar attachment, and finding same correct; then, in order to test the solar apparatus, by comparing the results of observations on the sun, for meridian, made during p.m. & a.m. hours, respectively, with a true meridian determined by observation of Polaris, I proceed as follows :-

At 4h p.m., l.m.t., at the Standard cor. of secs. 35 & 36, recently re-established by me, and heretofore described, Book B, Group 10, in lat.  $35^{\circ}30'34''$  N., long.  $113^{\circ}50'36''$  W., I set off  $22^{\circ}25\frac{1}{2}'$  S. on the decl.arc, and  $35^{\circ}30\frac{1}{2}'$  N. on the lat.arc, and determine a meridian with the solar, and mark a point in the meridian thus determined by a tack in a stake driven firmly in the ground 5.00 chs. N. of my station.

Dec. 6, 1910.

Dec. 7, 1910.

At 21.24m a.m., l.m.t., I observe Polaris at W. elongation, in accordance with instructions in the "Manual", and mark the line thus determined by a tack in a stake driven firmly in the ground 6 chs. N. of my station.

At 8h a.m., l.m.t., I set off the azimuth of Polaris,  $1^{\circ}26'$  to the East, and mark the true meridian thus determined by a tack in the stake 5 chs. N. of my station, which point falls .40 ins. E. of the point as determined by the solar on preceding evening.

Then I set off  $22^{\circ}30'$  S. on the decl.arc, and  $35^{\circ}30\frac{1}{2}'$  N. on the lat.arc, and determine a meridian with the solar, and mark a point in the meridian thus determined by a tack in the stake 5 chs. N. of my station, which point falls .35 ins. E. of the point determined by observation of Polaris.

The solar apparatus, by p.m. & a.m. observations, defines positions for meridians, about  $20^{\circ}$  W., and  $13^{\circ}$  E., respectively, of the meridian, as determined by Polaris observation.

These errors being probably the ordinary errors of observation, I conclude that the instrument is in satisfactory adjustment.

The magnetic bearing of the true meridian at 8h a.m., is N.  $15^{\circ}25'$  W.; the angle thus determined gives the magnetic declination as  $15^{\circ}25'$  E.

From the Standard cor. above described, I run, as per instructions,

Dec. 13, 1910.

## General Description.

T. 25 N., R. 15 W., lies in a level valley, draining to the West, the NE. cor. being in the foothills of the Music mountain cliffs.

The soil is mostly a loose sandy loam, very fertile, and would produce well, if irrigated.

Nearly all of the Tp. is covered with a fair growth of nutritious native grass, and scattering sage brush, and is excellent grazing land.

There is no water or timber in the Tp., and no trace of any settler or other occupation of the land.
