Survey commenced Feb. 21, 1911, and executed with a W. & L. E. Gurley light mountain transit, special make, unnumbered, with Burt's patent solar attachment. The horizontal limb of the instrument is provided with two double verniers placed opposite to each other and each reading to 1' of arc, which is also the least reading of the verniers of the latitude and declination arcs. Before beginning the survey of the subdivision of this Township, I examine, test and adjust the levels, the line of collimation, and standards of the instrument, and also the polar axis, and the solar lines and lenses of the solar apparatus.

Then, having all parts of the instrument in precise adjustment as to tests; in order to test the solar apparatus, by comparing the results of observations on the sun, for meridians, made during p.m. & a.m. hours, respectively, with a true meridian as determined by observation of Polaris; I proceed as follows:-

At 8h p.m., l.m.t., at the cor. of secs. 1, 2, 35 & 36, on the S. bdy. of the Tp., as re-established by me and heretofore described, lat.  $36^{\circ} 51' 36''$  N., long.  $113^{\circ} 57' 56''$  W., I set off  $15^{\circ} 51'$  S. on the decl. arc, and  $25^{\circ} 15'$  N. on the lat. arc, and determine a meridian with the solar, and mark a point in the meridian thus determined by a tack in a stake driven firmly in the ground 5 chs. N. of my station.

At 19h 25m p.m., l.m.t., I observe Polaris at W. elongation, in accordance with instructions in the "Manual", and mark the line thus determined by a tack in a stake driven firmly in the ground 6 chs. N. of my station.

Feb. 22, 1911.

Feb. 22, 1911.

At 8h a.m., l.m.t., I set off the azimuth of Polaris,  $1^{\circ} 25'$  to the East, and mark the true meridian thus determined by a tack in the stake driven in the ground 5 chs. N. of my station, which point falls  $\frac{1}{2}$  ins. E. of the point in the meridian as determined by the solar on preceding afternoon.

Then I set off  $15^{\circ} 40'$  S. on the decl. arc, and  $34^{\circ} 15'$  N. on the lat. arc, and determine a meridian with the solar, which meridian coincides with the meridian as determined by observation of Polaris.

The solar apparatus, by p.m. & a.m. observations, defines positions for meridians, about  $21^{\circ}$  W., and identical with the true meridian as determined by Polaris observation. Therefore, from these observations, I conclude that my instrument is in satisfactory adjustment.

The magnetic bearing of the true meridian, at 8h a.m., is N.  $15^{\circ} 20'$  W.; the angle thus determined gives the magnetic declination as  $15^{\circ} 80'$  E.

From the cor. above described,

I run, as per instructions,

**General Description.**

T. 22 N., R. 13 W. is somewhat mts. or broken in the  
 NE. & SW. portions, and rolling in the SE. and NW. por-  
 tions. The soil is in general loose, and dry, but would  
 produce well in much of the land in the centre of the  
 Tp., if irrigated. There is no water or timber in the Tp.  
 There are no settlers in the Tp., which is mostly good  
 grazing land.
