Survey commenced May 8, 1911, and executed with a W. & L. E. Gurley light mountain transit, special make, unnumbered, with Burt's patent solar attachment. The horizontal limb of the instrument is provided with two double verniers placed opposite to each other, and each reading to 1' of arc, which is also the least reading of the verniers of the latitude and declination arcs. Since it is impracticable to proceed to the Cor. of secs. 5, 6, 31 & 32, on the S. bdy. of T. 23 N., R. 14 W., in time to make a solar observation this p.m., I proceed as follows : -

At a point near my camp, at the corner of Tps. 23 & 24 N., R. 14 and 15 W., I examine and test carefully all the adjustments of my transit and solar apparatus. Finding all parts of my instrument in correct adjustment as to tests; then, in order to test the solar apparatus, by comparing the results of observations on the sun, for meridians, made during p.m. & a.m. hours, respectively, with a true meridian established by Polaris observation, I proceed as follows : -

At 4h p.m., l.m.t., I set off $17^{\circ}0'N.$ on the decl. arc, and $35^{\circ}25'N.$ on the lat. arc, and determine a meridian with the solar, and mark a point in the meridian thus determined by a cross on a fixed stone 5 chs. N. of my station.

May 8, 1911.

May 9, 1911. At 4h. 26m. p.m., l.m.t., I observe Polaris at Eastern Elongation, in accordance with instructions in the "Manual", and mark the line thus determined by a tack in a stake driven firmly in the ground 6 chs. N. of my station.

At 8h a.m., l.m.t., I set off the azimuth of Polaris, $1^{\circ}26'$ to the West, and mark the true meridian thus determined by a cross on the fixed stone 5 chs. N. of my station, which point falls .40 ins. E. of the point in the meridian as established by the solar on preceding evening.

Then I set off $17^{\circ}11'N.$ on the decl. arc, and $35^{\circ}25'N.$ on the lat. arc, and determine a meridian with the solar, and mark a point in the meridian thus determined by a cross on the fixed stone 5 chs. N. of my station, which point falls about .40 ins. E. of the point in the true meridian as established by observation of Polaris. The solar apparatus, by p.m. & a.m. hours observations, defines positions for meridians about $21^{\circ}W.$, and $21^{\circ}E.$, respectively, of the true meridian as established by Polaris observation. These errors being probably no greater than the usual or personal errors of observation, I conclude that my instrument is in adjustment.

From this mer., the N., S., E. & W. lines from this cor. are correct. The magnetic bearing of the true meridian at 8h a.m., is N. $15^{\circ}25'W.$; the angle thus determined gives the magnetic declination as $15^{\circ}25'E.$

At 9h a.m., l.m.t., at the cor. of secs. 5, 6, 31 & 32, on the S. bdy. of T. 23 N., R. 14 W. as re-established by me, and herefore described,

I set off $17^{\circ}11'N.$ on the decl. arc and $35^{\circ}29'N.$ on the lat. arc, and determine a true meridian with the solar. Thence I run, as per instructions,

Var. $15^{\circ}25'E.$,

General Description.

T. 23 N., R. 14 W., is in general mountainous and broken, and valuable only for grazing purposes except small areas along Truxton Wash in the vicinity of Hackberry village, and northerly along the wash.

The soil along this wash is a rich sandy loam, and water is found at a depth of 30 to 50 ft., which could be pumped and used for irrigation.

There are several small springs in the Tp., furnishing water for stock.

There is some pinon and cedar timber in the higher parts of the Peacock Mountains.

C. Ridenour, in N. half of sec. 26 has substantial dwelling house and other valuable improvements, and cultivates a small tract of land, irrigating from a small spring.

A number of settlers are located in Hackberry Village, a post office and railroad station in sec. 13, and NW. $\frac{1}{4}$ of sec. 24.

Those who have valuable dwellings and improvements, are Wm. L. Kayser & Co., Henry Bacon, Dan C. Bacon, William Grant, Chas. Ridenour, Tony Walters, Mrs. H. Grigg, Mrs. T.W. Phillips, Inus & Eperson. Wm. Cofer,

Mrs. Hand, Chas. Maine, and William Gordon, Chas. Logan.

The Atchison, Topeka & Santa Fe Railroad Co., has built large oil tanks, water tanks, and pumping plant near Hackberry Station, which is one of the principal supply and watering stations on the line.

The locations of the various buildings, etc., are as shown on the supplemental plat accompanying, made from actual survey by me on morning of May 19, 1911.

Some of the land in the Peacock Mountains is valuable mineral land, being rich in silver and gold ore, but this district remains undeveloped, except the old Hackberry mine, near U.S.L.M. No. 1, in NE. $\frac{1}{4}$ of sec. 28, from which much valuable ore was taken years ago, but which has not been operated for ten years or more.

SUMMARY.

Topographical and Geological Features.
Tps. 18 to 27 N., Rs. 13 to 16 W., Ariz.
as surveyed under
Groups 9 & 10.

Mountains.

The mountain ranges trend north-northwest, nearly parallel with the edges of the cliffs and plateaus. On the NE. of this area lie the Grand wash Cliffs, or the southern portion thereof. At Mucic mountain, these cliffs divide, the upper portion, which is sedimentary, extending Eastward, and called the Yampai cliffs, and the lower, or crystalline portion continuing to the SSE., under the names of Cottonwood Cliffs, and Aquarius Cliffs, forming the SW. edge of the Truxton Plateau, which plateau is more definitely located and shown in T. 24 N., R. 13 W. plat. The general trend of the slope is WSW. in to Hualpai Valley. The mean elevation of this plateau is 6800 ft. sea-level. The upper portion is a precipitous cliff, or scarp, about 1500 ft. in height, composed of nearly horizontal strata. Below this is a rugged, broken, mountainous slope, composed of crystalline or granitoid rocks, having a vertical range of 1000 ft. or more, not so steep as the higher portion. The lower or foot hill belt consists of irregular hills and ridges of granite formation, with immense local deposits of talus, fanshaped, descending to the East edge of the Hualpai Valley.

The Cerbat Range, lying on the West of the Hualpai valley, extends nearly N. & S. Only the East foothills of this range extend into the surveyed area.

These foothills are mostly basaltic or volcanic, and covered in places with granitoid talus or sediment. The Cerbat range and the Grand Wash Cliffs are connected by a low divide, only about 300 ft. above the level of Red lake on the North.

The Peacock Mountains lie North-east of the Hualpai range, between them and the Cottonwood Cliffs, and interrupting the continuity between the Hualpai and Big Sandy Valleys.

The Northern portion of this range extends into the surveyed area, and also the East and West foothills. The formation is granitic, the Western slope being very steep, and rugged.

The Hualpai Mountains lie mostly to the South of the surveyed area, only the northern foothills and ridges extending into the surveyed area.

The formation is ancient granitoid or pre-Cambrian, inclined Easterly, making the West slope very steep.

Hualpai valley lies between the Grand Wash Cliffs on the east and north-east, and the Cerbat range on the west, extending to the Peacock and Hualpai mts. to the south.

This valley is mostly an undrained basin, about 50 miles long and 10 to 20 miles wide.

The lower portion, which has an elevation of about 3000 ft. above sea level, covering an area about 10 miles N. & S., and 6 miles E. & W., is known as Red Lake. This lake is a dry, barren mud flat, most of the time, owing to the evaporation or absorption of the flood waters.

The principal drainage of the basin comes through Truxton wash, the bed of which is usually dry. In flood times during the rainy season, this basin contains water for periods varying from a few days to several months.

The drainage area of this basin is not great, as the higher plateau on the East drains away from Hualpai Valley into the Colorado River, while the drainage from the ranges to the West, north, and south is so small as to be negligible.

Truxton wash is usually dry, but at times contains floods of enormous volume, which spread out in the valley. From surface indications, the Hualpai Valley would seem to have an underground water supply, as it is an undrained basin. Much of this valley is very fertile.

The only wells in this valley are at Hackberry, in the extreme eastern edge, about 500 ft. above the lower part of the valley.

The wells sunk here struck solid granite at a depth of about 70 ft., and a limited supply of water is obtained. At Kingman, in the extrem SW. edge of the valley, about 60 wells have been sunk, which are from 100 to 200 ft. in depth, according to the difference in surface elevation, indicating that there is a general water level.

Abundance of good water is obtained from these wells for the uses of the town and railroad. The drainage at Kingman is away from the valley, through Kingman Pass.

The northern portion of the Big sandy valley lies in the southern portion of the lands surveyed, between the Aquarius cliffs on the East, and the Hualpai Mts. on the west.

Several streams of considerable size emerge from the plateau on the east, through deep, narrow canyons, and discharge into the Sandy, the principal of which is Trout and Sycamore creeks.

But little of the land in the Sandy Valley is suitable for irrigation and cultivation.

Water is found at from 50 to 100 ft. in most parts of the valley in the lower portions near the River.

The Sandy River runs only during the rainy seasons, but has an underground flow throughout the year.
