Survey commenced June 10, 1910, and was executed with a Young and Sons' light mountain transit No. 7520, with a Smith Solar Attachment. The horizontal limb is provided with two double verniers placed opposite to each other, and reading to single minutes of arc, which is also the least reading of the latitude and declination arcs of the solar attachment.

The instrument was examined, tested on a true meridian at Phoenix, Arizona, found correct, and approved by the Surveyor General for Arizona, June 25, 1904.

I examine all of the adjustments of the transit, and find them correct, and then in order to test the solar apparatus by comparison of a.m. and p.m. observations with a true meridian deflected from a Polaris observation at elongation, I proceed as follows:

At the cor. of secs. 1, 2, 35 and 36 on the S. boundary of T. 20 N. R. 10 W. recently established by me, and described, I set off 35° 04 1/2' N. on the lat. arc; this being the latitude of the place; 23° 01 1/2' N. on the decl. arc; and at 4h. 00m. p.m., l.m.t., determine a meridian with the solar, and mark the line thus determined by a tack driven in a stake set about five chains N. of my station.

June 10, 1910.

June 11, 1910. At 2h. 12m. a.m., l.m.t., I observe Polaris at eastern elongation in accordance with instructions in the Manual, and mark the line thus secured by a tack driven in a stake set about 5.00 chains north of my station to the east of the stake driven last night after the solar observation.

At 5h. 00m. a.m., l.m.t., I turn off 1° 26' W., and mark the true meridian thus determined by a tack driven in the same stake set yesterday afternoon at 4h. 00m. p.m., The p.m. solar observation marks a meridian 0.1 of an inch west of the true meridian.

At 7h. 00m. a.m., l.m.t., I set off 35° 04 1/2' N. on the lat. arc; 23° 04 1/2' N. on the decl. arc, and determine a meridian with the solar. This, the a.m. observation falls 0.15 inch east of the true meridian. I conclude the observations and declare the instrument in satisfactory adjustment throughout.

GENERAL DESCRIPTION.

This township is rolling and mountainous in the eastern half where the soil is generally rated 2nd and 3rd rate, and is covered with a dense undergrowth of greasewood, cactus, yucca, catsclaw, palo verde, but with very little grass and no water either at the surface or from wells. At near the center of the township on a line nearly north and south in direction the subdivisional lines enter mountainous land impractical to subdivide. There is a scattering growth of cedar timber in the extreme NE. part of the township but for this exception the township is destitute of timber. In the prosecution of the survey it was necessary to haul water a great distance, and this combined with the extreme high temperature, the absence of grass, and the rough character of the land embraced, as well as the dense undergrowth encountered sufficed to classify this as an extremely difficult survey to execute.

It is worthy of note that there are no settlers within this township, and it appears to be an impractical region for settlement on account of the scarcity of water and the poor quality of the soil.
