Subdivision of Township 18 North, Range 19 West.
Chains.

Survey commenced December 18, 1911, and was executed with a Young and Sons' light mountain transit No. 7520, the horizontal limb having two double verniers placed opposite to each other, and reading to single minutes of arc, which is also the least reading of the latitude and declination arcs.

The instrument was examined, tested on the true meridian at Phoenix, Arizona, found correct, and approved by the U. S. Surveyor General, June 26, 1904.

I commence at the cor.of secs.1,2,35 and 36 on the S.bdy. of the township, recently established and described by me. Lat. $34^{\circ}53'57''N.$; long. $114^{\circ}13'29''W.$

At 4h.0m.p.m., l.m.t., I set off $23^{\circ}19\frac{1}{2}'S.$ on the decl. arc; $34^{\circ}54'N.$ on the lat.arc, and determine a meridian with the Smith Solar Attachment to this instrument. I mark the line thus determined by a tack driven in a stake about five chains north of my station.

December 18, 1911.

December 19, 1911. At 1h. 37m. a.m., l.m.t., I observe Polaris at its western elongation in accordance with the instructions in the Manual, and mark the line thus determined by a tack driven in a stake set about five chains north of my station.

At 8h.0m. a.m., l.m.t., I turn off the azimuth of Polaris $1^{\circ}25\frac{1}{2}'$ to the east, and mark true meridian by a tack driven in the stake set yesterday by solar observation. The solar meridian by p.m. observation is $\frac{1}{8}$ of an inch east of the true meridian.

At 9h.0m. a.m., l.m.t., I set off $34^{\circ}54'N.$ on the lat. arc; $23^{\circ}22\frac{1}{2}'S.$ on the decl.arc, and determine a meridian with the solar, and find that this line falls one eighth of an inch west of the true meridian. I conclude after a thorough examination of the plate bubbles and the standard adjustments of the instrument which I find correct, that the entire instrument is in satisfactory adjustment.

Thence I run,
 $N.0^{\circ}04'W.$ between secs. 35 and 36.
Over extremely mountainous land, covered with boulders and loose rock; scattering greasewood and cactus brush.

Ascend.

GENERAL DESCRIPTION.

Township 18 North, Range 19 West embraces land apparently of a worthless character, there being not an acre of tillable land within the boundaries thereof. The soil is practically all 4th rate, stony, no timber, and

the brush generally scattering greasewood and cactus, with occasionally small patches of catclaw. There is for all practical purposes no grass for grazing, as there is very little of the same in scattered patches. A spring carrying approximately two miners inches of water rises in the SW. $\frac{1}{4}$ of sec.33. The water is quite appreciably warm and rather alkaline. There are two springs in the northern part of the township, one being situated near the north $\frac{1}{4}$ cor. in sec.9, and the other being in the NW. $\frac{1}{4}$ of sec.10. Both are alkaline, but of fair domestic quality. The southwestern half of the township is drained by Warm Springs Canyon and its tributaries; while the northeastern half drains northeasterly into the Sacramento Wash. The center of the main range of the Ute Mountains passes in a northwesterly and southeasterly direction through the middle of this township. The entire area is mountainous, and in some cases nearly impassable. This surface was in a former geological period capped by a lava outflow, which has since been disintegrated by the sun and elements and washed away, leaving high ridges and cutting deep canyons, and leaving the whole area peppered with black malpais boulders. The surface varies in elevation from 4200 to 2200 feet above the sea. There are no settlers within this township. The climatic conditions are very irregular, the region being very hot in the summer, temperature reaching nearly 120° F. in the shade, while in winter it is very cold and windy. The rainfall varies from 0 to 14 ins. in depth per year, and is torrential in character. A few wild burros were seen during the progress of this survey, but otherwise no animal life was in evidence probably due to the scarcity of feed, there being no nutritious grasses in appreciable quantity.
