Chains.	Survey commenced November 20, 1912, and executed with a Young & Sons light mountain transit No.10 with a Smith Solar attachment. The horizontal limb is provided with two double verniers placed opposite to each other reading to single minutes of arc, which is also the least count of the verniers of the verniers of the latitude and declination arcs.
	I examine the adjustments of the transit and find them correct, and know from recent tests of the solar apparatus by comparing its indications resulting from solar observations made during a.m., and p.m. hours with a meridian determined by observations on Polaris, that the instrument is in satisfactory adjustment.
	At 7 ^h . 46 ^m . a.m., l.m.t., I set off 32°41' N. on the lat. arc, 19°38' S on the decl. arc, and determine a meridian with the solar at the cor. of secs. 35 and 36 on S. bdry of Tp., which is an iron post 3 ins. in diam. 12 ins. above ground, firmly set, marked on brass cap and witnessed as described by the Surveyor General.

General Description

The land in this township varies from level to mountainous and the soil ranges from a rich sandy loam to alkali. The soil of the bottom lands along the Gila River is a rich alluvial loam, but owing to the arid condition of the country will not produce without irrigation. The soil of the hilly and mountainous portions of the township is mostly a stony clay loam underlaid with stone and gravel and worthless except as a stock range. Cottonwood and willow timber is found along the Gila River while mesquite, and ironwood grow in nearly all of the sand washes which cut through the township. The township is poorly watered over the greater portion although during the cooler part of the year there is water in the Gila River. There are three settlers residing in the township at the present time, all of whom are in sec. 36.
