Red lines indicate surveys executed by William B. Kimmel, U.S.Cadastral Engineer, on dates shown thereon.

Blue lines indicate surveys executed by Francis R. Ihrie, U.S.Transitman, on dates shown thereon.

For date of survey of this line see Book Gp.109

Surveys hereinafter described were executed by William B. Kimmel, U.S.Cadastral Engineer and Francis R. Ihrie, U.S.Transitman, on dates shown on diagram on page 1 hereof, using respectively Young and Sons' light mountain transits Nos.8540 and 8477. For description of instruments and certificates of approval, see Books "A" and "B".

Field Tests of Instruments.

We examine the adjustments of the transits and correct all errors; then, to test the solar apparatus, by comparing their indications, resulting from solar observations made during a.m. and p.m. hours, with a meridian determined by observations on Polaris at elongation, we proceed as follows:

June 5, 1921: at our camp in sec.16, T.28 N., R. 14 W., lat. $35^{\circ}48\frac{1}{2}'$ N., long. $113^{\circ}48'$ W., at 2 hrs. 42.8m.a.m., we observe Polaris at eastern elongation, in accordance with the Manual of Instructions, and mark a point in the line thus determined by a tack in a stake, firmly driven in the ground, 5 chs. N. of our station.

At 8 hrs. 0 m., a.m., l.m.t., we lay off the azimuth of Polaris, $102^{\circ}25'$ to the west, and mark the true meridian thus determined by a tack in a stake, firmly driven in the ground, 5 chs. N. of our station.

At 9 hrs. 0 m., a.m., l.m.t., we set off $35^{\circ}48\frac{1}{2}'$ N. on the lat.arcs; $22^{\circ}32\frac{1}{2}'$ N. on the decl.arcs; and determine a meridian with each solar, which agrees with the true meridian.

At apparent noon, with the lat.arcs. unchanged, we observe the sun on the meridian with each solar; the resulting decl. in each case is $22^{\circ}33\frac{1}{2}'$ N., which is the computed decl. of the sun..

At 3 hrs. 0 M., p.m., l.m.t., with the lat. arcs. unchanged, we set off $22^{\circ}34\frac{1}{2}'$ N., on the decl.arcs. and determine a meridian with each solar, which in each case agrees with the true meridian.

As all of the solar observations during the usual hours of solar work come within $1'30''$ of the true meridian, we conclude that the adjustments of the solars are satisfactory.

Unless otherwise specified, all measurements are made with a Lufkin steel tape, 5 chs. in length, compared with a Chesterman standard steel tape and found correct. The measurements are made on the slope, the vertical angles determined and the slope measurements properly reduced to true horizontal distances.

By triangulation, I determine a base as follows from which to triangulate to the cor.: From the 45.30 ch. point, "A", set a flag "B" on a bearing S.26°31'W. From "A" measure a base West 8.00 chs., to "C". From "C" flag "B" brs. S.14054'E. From "BW" flag .74 chs. N. of cor. of secs. 25, 30, 31 and 36 brs. N.74013'E.

The three angles of the triangle ABC are 75°6', 63°29' and 41°25', the sum of which is 180°. The length of the side AB is determined by the sine proportion:

$$\frac{\sin. 75^{\circ}6' \times 8.00}{\sin. 41^{\circ}25'} = AB$$

The three angles of the other triangle are 118°2', 14°16' and 47°42', the sum of which is 180°. The distance to the cor. on the bearing N.88°29'E is found from:

$$\frac{X}{AB} = \frac{\sin. 47^{\circ}42'}{\sin. 14^{\circ}16'}$$

By substitution,

$$X = \frac{\sin. 47^{\circ}42' \times \sin. 75^{\circ}6' \times 8.00}{\sin. 41^{\circ}25' \times \sin. 14^{\circ}16'}$$

$$\log. \sin. 47^{\circ}42' = 9.869015$$

The three angles of the triangle are therefore $8001'$, $85018'$ and $14041'$, the sum of which is 180° . The distance triangulated is given by the sine proportion:

- $\log. 14.00 = 1.146128$

 $\log. \sin. 14041' = 1.144665$

ceed as follows:

From a flag "A", 11.29 chs. East
and 3.76 chs. North of the stan-
dard cor. of secs. 31 and 32,
T. 29 N., R.14 W., flag "B"

measure a base N:54°7'E. 38.22
chs. to flag "C". From "C", flag
"B" brs. S.13°23'W. The three
angles of the triangle are there-
fore 87°, 40°44' and 52°16', the
sum of which is 180°.

The length of line AB is found from the sine proportion:

$$\frac{X}{38.22} = \frac{\sin. 40^{\circ}44'}{\sin. 52^{\circ}16'}$$

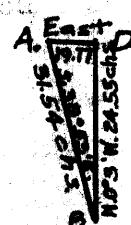

$$\begin{array}{rcl} \log. 38.22 & = & 1.582291 \\ \log. \sin. 40^{\circ}44' & = & 9.814607 \\ \sqrt{} & & 1.396898 \\ \log. \sin. 52^{\circ}16' & = & 9.898104 \\ \log. X & = & 1.498794 \\ X & = & 31.54 \text{ chs.} \end{array}$$

If the line bet. secs. 5 and 6 were extended to meet line
produced East from "A" at point "D", the three angles
of the triangle ABD would be 51°7', 90°3', and 38°50',
the sum of which is 180°, and the lengths AD and BD
are found from the sine proportion:

$$AD = \frac{\sin. 38^{\circ}50'}{\sin. 90^{\circ}3'} X 31.54$$

$$\begin{array}{rcl} \log. \sin. 38^{\circ}50' & = & 9.797307 \\ \log. 31.54 & = & 1.498794 \\ \log. \sin. 90^{\circ}3' & = & 1.296101 \\ 0 & & 1.296101 \\ AD & = & 19.77 \end{array}$$

$$BD = \frac{\sin. 51^{\circ}7'}{\sin. 90^{\circ}3'} X 31.54$$

Chains

log.. 31.54	=	1.498794

		1.390011
log.sin.90°3'	=	0
log. BD	=	<u>1.390011</u>

The theoretical length of the line bet. secs. 5 and 6 is therefore $60.86 + 24.55 - 3.76 = 81.65$ chs.
 The closing distance West from the standard $\frac{1}{4}$ sec.cor.of sec.32,T.29N.,R.14W. is therefore $40.00 - 11.29 - 19.77 = 8.94$ chs.

The continued satisfactory adjustment of the solars during the survey of this township is indicated from field tests as described in Book "E".

GENERAL DESCRIPTION

The portion of this township surveyed under this Group is rolling and mountainous land, covered with a scattering growth of cedar and juniper, pine and pinyon timber and buck brush, scrub oak, sagebrush, rabbit brush, Spanish dagger and cactus undergrowth. The soil is rocky, 2nd and 4th rates. A portion of the northern tier of secs. is rendered unsurveyable by deep canyons tributary to the Grand Canyon. There are no settlers. Roads lead from a fenced enclosure in sec. 20 to Clay Springs. No indications of mineral were observed in this township.
