Accepted survey.

Surveys herein described were executed on dates shown on diagram on page 1 hereof, by William H. Thorn, U.S.G.E., and Ty White, U.S. G., using respectively, Young & Sons light mountain transits Nos. 8592 and 8540; both instruments are equipped with full vertical circle and Smith solar attachment; unless otherwise specified, all azimuth determinations are accomplished with the solar attachment.

February 16, 1923: We examine the adjustments of the transits and correct all errors; then, to test the solar apparatus, by comparing their indications, resulting from observations made during a.m. and p.m. hours with a meridian established by observations on Polaris, we proceed as follows:

At camp near the cor. of secs. 15, 16, 21 and 22, T. 7 N., R. 15 W., G. and S. R. B. and M., Arizona, lat. $33^{\circ} 56\frac{1}{2}'$ N., long. $113^{\circ} 49'$ W., at 9 hrs. 45 $\frac{1}{2}$ m., p.m., l.m.t., we observe Polaris at western elongation, making four observations, two each with the telescope in direct and reversed positions, and mark the mean point in the line thus determined on a peg driven firmly in the ground, 6 chs. North.

Azimuth of Polaris at western elongation, $1^{\circ} 19' 47''$.

February 17, 1923: At 8 hrs. 5 m., a.m., l.m.t., we lay off the azimuth of Polaris, $1^{\circ} 20'$ to the east, and mark the meridian thus determined by a tack in a peg driven firmly in the ground, 5 chs. North.

February 18, 1923: At 9 hrs. 0 m., a.m., l.m.t., we set off $33^{\circ} 56\frac{1}{2}'$ N. on the lat. arcs; $11^{\circ} 47\frac{1}{2}'$ S. on the decl. arcs; and determine a meridian with each solar, which agrees with the true meridian.

At apparent noon, with the lat. arcs unchanged, we observe the sun on the meridian with each solar; the resulting reading of each decl. arc is $11^{\circ} 45\frac{1}{2}'$ S., which agrees with the computed decl.

At 3 hrs. 0 M., p.m., l.m.t., with the lat. arcs unchanged, we set off $11^{\circ} 42\frac{1}{2}'$ S. on the decl. arcs and determine a meridian with each solar, which we find to agree with the true meridian.

As all of the solar observations during the usual hours of solar work come within $1' 30''$ of the true meridian, we conclude that the adjustments of the instruments are satisfactory.

Unless otherwise specified, all measurements are made with a Lufkin steel tape, 5 chs. in length, compared with a Lufkin 1 ch. standard steel tape and found correct. The measurements are made on the slope, the vertical angle determined and the slope measurements properly reduced to true horizontal distances.

The continued satisfactory adjustment of the solars during the survey of this township is indicated from field tests as described in Book "K."

GENERAL DESCRIPTION.

With the exception of a long, low ridge in the southeast quarter of the township, and north half of the west two ranges of sections, which are hilly or mountainous land, of rocky, 3rd and 4th rate soil, this township is level land, of 2nd rate sandy loam soil. Ironwood, palo verde and mesquite timber are found along the draws and washes, and greasewood and cactus undergrowth over all the township. The main drainage is into Cunningham Wash, which flows in a southwesterly direction, dividing the township nearly into halves.

There are no active mines in the township, nor any known bodies of mineral.

A small frame house and windmill are located in the SW. quarter of sec. 2, and a small house in the NE. quarter of sec. 28. No settlers were living in the township at the time of survey.

This township is good grazing land.
