OF THE RESURVEY OF THE

the NORTH BOUNDARY of Fractional Township 23 South, Range 10 East

AND OF THE SURVEY OF THE

SUBDIVISION LINES of

Fractional Township 23 South, Range 10 East

Of the Gila and Salt River Base and Meridian,

In the State of Arizona

EXECUTED BY

William B. Kimmel, U.S.Cadastral Engineer

and

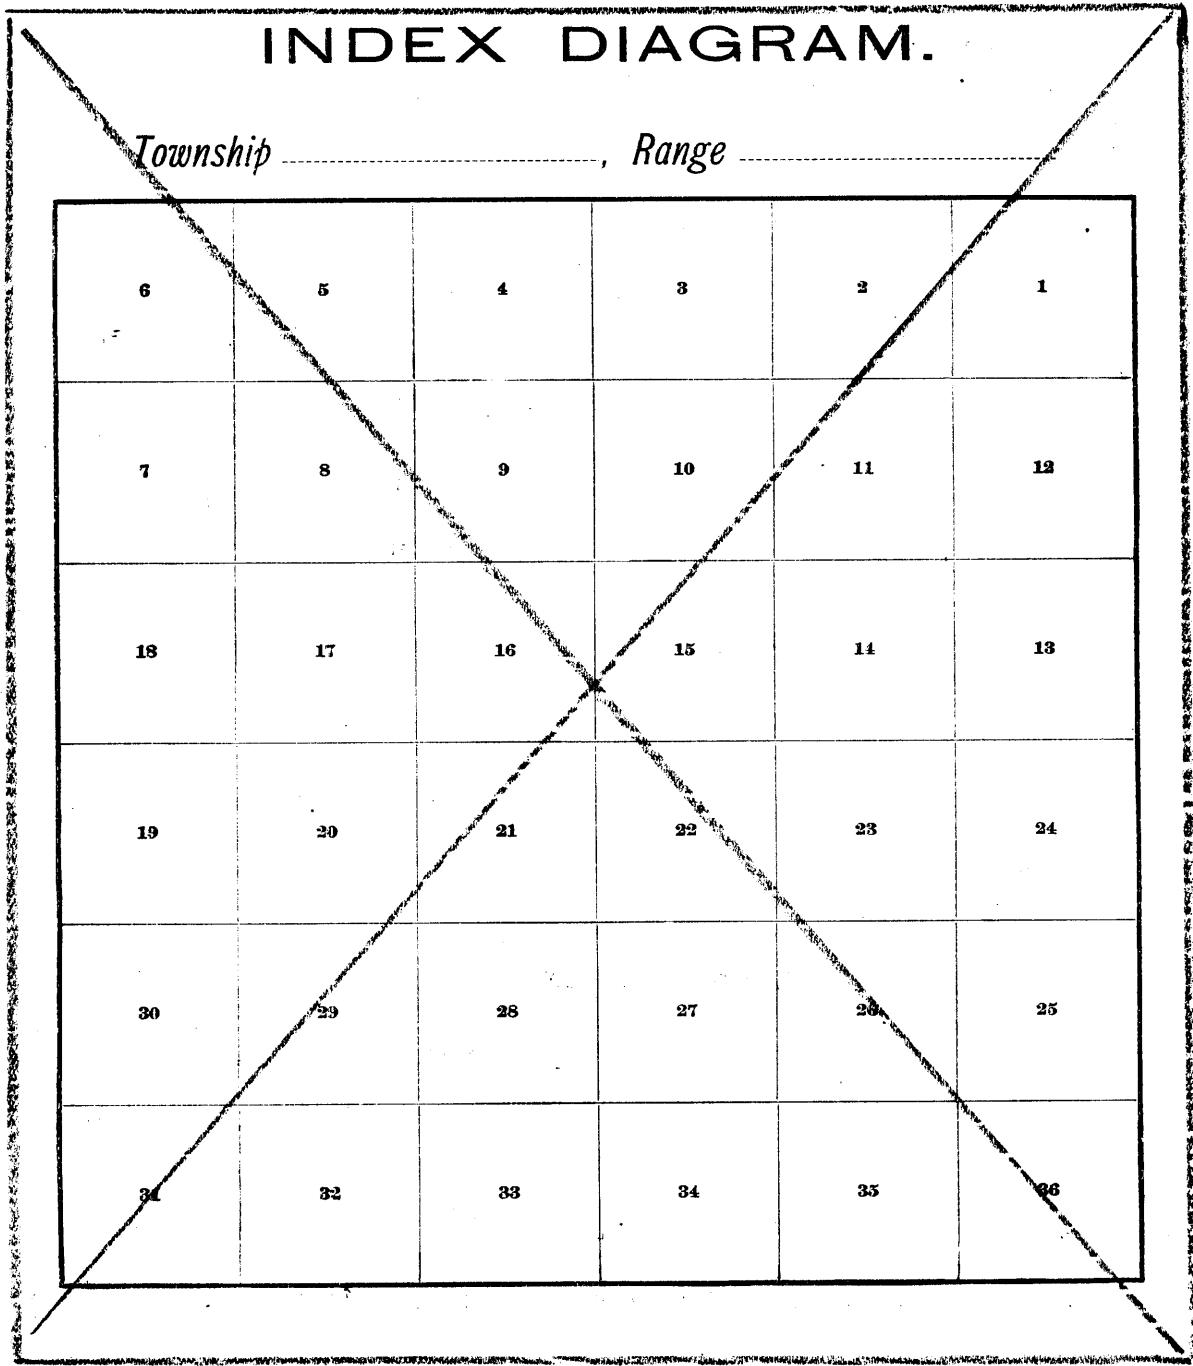

Claude F. Warner, U.S.Transitman

In the capacity of U. S. Surveyors, under Special Instructions dated September 24, 1925, issued by the U.S.District Cadastral Engineer to govern surveys included in Group No. 138, Arizona, which were approved by the Commissioner of the General Land Office, October 14, 1925, and Assignment Instructions dated November 2, 1925.

Resurvey and Survey commenced February 23, 1926

Resurvey and Survey completed March 7, 1926.

6-181

Resurveys and surveys herein described were executed on dates shown on diagram on page 1 hereof, by Wm. B. Kimmel U.S.Cadastral Engineer, using W. & L. E. Gurley transit No. 20120, and Claude F. Warner, U.S.Transitman, using Young and Sons transit No. 8292, both instruments equipped with full vertical circles and the Smith solar attachment. The horizontal limbs are provided with two double verniers placed opposite to each other, reading to  $30''$  of arc on the Gurley and  $1'$  of arc on the Young and Sons. The verniers of the vertical circles and of the solar attachments read to  $1'$  of arc.

Unless otherwise specified all measurements are made with Lufkin steel tapes, 5 chains long, compared with a Lufkin standard steel tape and found correct. The measurements are made on the slope, the vertical angle determined with transit or clinometer, and the slope measurement properly reduced to true horizontal distances. Unless otherwise specified, all azimuth determinations were accomplished with the solar attachment.

February 21, 1926:

We examine the adjustments of the transits and find them correct, then to test the solar apparatus, by comparing their indications, resulting from observations made during a.m. and p.m. hours with a meridian established by Polaris observation, we proceed as follows:

In camp in the NW $\frac{1}{4}$  of the NE $\frac{1}{4}$  of Sec. 12, Fran. T. 23 S., R. 10 E., in latitude  $31^{\circ} 27' N.$ , and longitude  $111^{\circ} 16' W.$  Knowing that my watch is correct standard time, (having checked it frequently with Radio announcements.) which is 25m 8s fast of local mean time, At 6h 34m p.m., l.m.t., the mean time of four observations, make an hour angle observation on Polaris west of the meridian, making four observations, two each with the telescope in direct and reversed positions, and mark the mean point in the line thus determined, on a stake driven firmly in the ground, about 5 chs. N. (Gurley transit used)

February 22, 1926, lay off the azimuth of Polaris,  $55'$ , to the east, and mark the meridian thus determined, on a stake driven firmly in the ground about 5 chains N. February 22, At 9h a.m., app.t., Set off  $31^{\circ} 27' N.$  on the lat. arcs;  $10^{\circ} 16' S.$  on the decl. arcs; and determine meridians with the solars, which agree within  $1'$  of the true meridian.

At apparent noon, with the latitude arcs unchanged, observe the sun on the meridian; the resulting reading of the declination arcs is  $10^{\circ} 14' S.$ , which agrees with the computed decl. of the sun.

At 3h p.m., app.t., with the lat. arcs unchanged, set off  $10^{\circ} 11' S.$  on the decl. arcs; and determine meridians with the solars, which agree within  $1'$  of the true meridian.

As all of the solar observations taken during the usual hours of solar work come within  $1'$  of the true meridian we conclude that the adjustments of the instruments are satisfactory.

The instruments were maintained in adjustment throughout the survey.
