Donald E. Harding, Cadastral Engineer

T. 7 N., R. 18 W.

BOCK 4448

The west boundary of T., 7 N., R. 17 W. was surveyed by Hesse in 1909. The following field notes describe the dependent resurvey of this boundary and the survey of the north and west boundaries and subdivisional lines of T. 7 N., R. 18 W.

The survey was executed with light mountain sclar transits made by Buff and Buff, serial No. 16424, and W. and L. E. Gurley, serial No. 461265, constructed in accordance with the standard instrumental specifications of the Bureau of Land Management. The instruments were in good condition and having been placed in satisfactory adjustment prior to the beginning of the survey, were tested and found free from appreciable error.

The direction of the lines were determined by the solar transit method. The measurements were made with Lufkin steel tapes, 5 chains in length, graduated to tenths of a link for the first ten links, and every link for the balance of the first 100 lks. and the remainder at intervals, of 10 links. The tapes were tested by comparison with a standard steel tape and found correct. The measurements were made on the slope and the vertical angle of each interval was ascertained by a clinometer in good adjustment; the horizontal equivalents only are entered in this field note record. Lines connecting previously established corners are run by the random and true method but the random lines are omitted from the field notes.

The data furnished with the special instructions give the geographical position of the southeast corner of the township as latitude 35°55'55" No and longitude 114°04'42" Wo

February 24, 1953, at camp in sec. 6, T. 7 N., R. 17 W., G. and S. R. Mer., Arizona, in latitude 33°58'56" W. and longitude 114°04' 29" W., I make an hour angle observation on Polaris west of the meridian for azimuth, making four observations, two each with the telescope in direct and reversed positions. Reading the horizontal angles from the east edge of a telegraph pole approximately 40 chains N., W. to Polaris.

February 25, 1953, every 30m. from 8 to 10:30 a.m. and from 1:30 to 4 p.m. we make the proper settings on the arcs of the solar attachments and ascertain that the resulting erientation of the instruments, when compared with the meridian established by Polaris observation, have a maximum error of less than 1:30 %.

General Description

The Plemesa Mountains cross the southeast corner of Township 7 North, Hange 18 West, with elevations up to 1900 ft. above sea level, while the remainder of the township is spread across the La Posa Plain with elevations from 700 to 1100 ft. Except for the rocky mountainous area the soil is all sandy, and a minimum of moisture supports a scattering growth of greasewood undergrowth with occasional spots of scrub palo verde and ironwood timber. The drainage is in a northerly direction from the mountainous southeast section to the Bouse Wash, which parallels the north boundary just outside of the township.

There are no traveled roads or improvements within the township.
